The Problem

In a food processing business, the accuracy of stock management data quickly and directly affects profit margins. Companies traditionally apply significant and costly manual resources to collect a snap-shot of stock at a particular point in time. Unfortunately, the benefit of this is degraded by the effect of continual fluctuation. This makes stock data expensive to collect, quickly redundant and prone to inaccuracy.

The Solution

Integrator® allows processors to ensure complete accuracy and control in all areas of stock management. This includes intake, raw materials, dry goods, shelf and least life validation, work in progress, finished goods and soft allocation. Data is collected using a range of devices, including touchscreens and PDAs, which work wirelessly to record data in real time.

The Result

Stock inventory information is accurate and up to date. Management have an instant view of on-hand stock, available stock and shelf life status. This enables operators to know the exact age of each item and where it is located.

Ultimately, improved speed and accuracy delivers significant cost savings, allowing food processors to improve output.

Major Benefits

- continuous stock location control
- single or multi warehouse visibility
- real-time stock availability
- analysis to case level within location
- links to OCM, scanners and touchscreens
- simple location of stock
- colour coded 'use by' alerts
- full stock take facilities
- 'drill down' on key columns
- hyperlink reporting
- data export facility
- feature level access control
- view by status
- multiple authorisation levels
- forecast inclusion
- full auditing capability

In-Line Stock Booking

Our Auto Stock Booker solution can save you time and money. Linking to a fixed scanner at the end of your production line, it can book your products directly into stock as they are coming off the production/packing line.

All of the items which are scanned into stock are recorded in our database, along with the time that they were scanned. This data can be captured and reported on to provide an overview across the day. Management are then able to view an otherwise unseen key performance indicator. When this data is viewed over days, weeks and months, it can be used to enable continuous process improvements.

What is a Tracker?

A tracker is a web-based tool which allows operators to view data from anywhere using an internet connection. Please see below for some of the benefits of this feature:

- can be used to review business performance when away from site
- real time updates for complete visibility
- most information is available on one screen for easy access
- data can be exported to Microsoft Excel
